MATH 308 Assignment 3

Exercises 1.11

Nakul Joshi

March 5, 2014

2

a)

Observational study.

b)

No, because it is possible that people without dementia are predisposed to drinking alcohol.

3

a)

Observational study.

b)

No, because it is likely that students who already use marijuana would be interested in listening to music that had references to marijuana.

 $\mathbf{c})$

No, because the study sample was not collected in a controlled, randomized fashion. Further, it excludes students who are not in high school.

5

Number of unique subsets of size N is $\binom{N}{n}$. The number of unique subsets that include a given $\,$ a half-chance of being in no samples. So, if t samples

individual is $\binom{N-1}{n-1}$. \therefore Required probability

$$= \binom{N-1}{n-1} / \binom{N}{n}$$

$$= \frac{(N-1)!}{(N-n)!(n-1)!} \times \frac{(N-n)!n!}{N!}$$

$$= \frac{(N-1)!}{N!} \times \frac{n!}{(n-1)!}$$

$$= \frac{n}{N} \quad \Box$$

This formula does not change with the individual. Therefore, by symmetry, every person has an equal chance of being in the group.

6

a)

From (5), with $N = 10^8$ and $n = 10^3$, required probability $p = n/N = 10^{-5}$.

b)

Probability of not being in any of 2000 independently chosen samples = $(1 - p)^{2000} \approx 98\%$.

c)

A half-chance of being in at least one sample implies

are chosen,

$$q^{t} = 0.5$$

$$\Rightarrow t \log q = \log 0.5$$

$$\Rightarrow t = \frac{\log 0.5}{\log(1 - 10^{-5})}$$

$$= 69315$$
